

HP 12c Calculator - Clearing Storage Registers

The HP 12c Financial calculator clears a single storage register by storing zero into it, that is, it replaces the number in the storage register with zero. The storing operation automatically clears the register before the data is stored, so there is no need to clear a storage register before storing data. To clear all storage registers at once, including the financial registers, the stack registers, and the LAST X register,

press **f** **CLEAR** **REG**. This also clears the display.
